

8 REASONS WHY TUTORING IS IMPORTANT TO US AT BRIGHT FUTURES LAB, LLC

1

Traditional Tutoring

Research shows that traditional tutoring can help students boost their self-confidence levels. While this may not help your child get better grades right away, it can be extremely beneficial long term. A self-confident student is more likely to participate, answer questions, and less afraid of making mistakes.

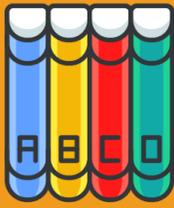

2

Academic Potential

Tutoring helps increase your child's motivation and attitude so he or she is able to reach his or her full academic potential. Tutoring helps teach students to think critically about problems and how to solve them. These skills help your child face and overcome challenges he or she faces in the classroom.

3

Teaching Methods

Teaching methods that involve research and discovery produce much more effective results. This is due to students being actively involved in figuring out why and how something works. This develops critical thinking, which can not only boost academic performance but help in the work environment in the future.

4

Research Based Methods

Research-based methods are also more entertaining and engaging for students and can increase their intrinsic motivation. However, they also require more preparation on the teacher's or tutor's part, which is why not all teachers are able to utilize them in the classroom on an individual level.

5

Processing Time

In a general large classroom setting, students have different learning styles and speeds. Therefore they do not process and assimilate information at the same rate. Some students will do so faster; others will not be able to fully do it by the time that the class move on to a new topic. Studies show that allowing ample time to process and assimilate information yields more significant results. How long each student needs will vary.

6

Relationships

A study has shown that students have improved results if they can relate to their teacher. This also means that working the same tutor long-term is also beneficial for improved results.

7

Coordinating with School

Studies have shown that tutors who coordinate private tutoring sessions with the curriculum taught at school help students more than teaching unrelated topics. This doesn't mean that tutors need to teach exactly what's been taught at school. Instead, they can provide additional, hands-on practice that helps reinforce school material and make it more applicable and relatable.

8

Success

A study concluded that frequent traditional tutoring sessions, even if they are shorter, produce better results. In addition to that, the study evaluated tutoring sessions of different duration (from 10-60 minutes) and longer sessions did not necessarily yield more successful results. It was their frequency that mattered more, but of course this depends on the individuality of your child.
